

News Release

TYPHOON HAS COMPLETED ITS STRIPPING ACTIVITIES IN THE FAYOLLE DEPOSIT SECTOR

Laval, Canada, August 10, 2010 – **Typhoon Exploration Inc. (TSX Venture Exchange Symbol: TYP)** announces that the stripping activities in the area of the Fayolle deposit have been completed. A total of 5 outcropping zones were cleared mechanically.

The first zone creates a north-east extension of a stripping operation previously carried out by Typhoon. The second extends a stripping area near drill hole FA-05-15 (43.51 g/t over 25.1 m) northward. The third stripping includes an enlargement of the historic Quebelle showing, and the fourth is located east of the Fayolle deposit. Finally, the fifth stripping zone consists of an extension of the Vang showing. A total of 150 channel samples measuring 0.5 m long were collected and sent for analysis to the ALS-Chemex lab in Val-D'Or. Results are pending.

The objective of these activities was to gain a better structural and geological understanding of the stratigraphy and of the gold bearing mineralization.

The company is very optimistic about the future of the Fayolle Project. **The metallogenic context of the Fayolle project is favourable to the existence of porphyry-type gold mineralization. The mineralized zones on the Fayolle Deposit are distributed along a major shear corridor of approximately 2.5 km long by 1 km wide, all while remaining open at depth. Higher gold grade intervals in the range of 10 to 40 grams per tonne have been encountered over 3 to 30 meters during previous drilling.**

Mr. Robert Gagnon, P. Geo., Technical Advisor, a Qualified Person as defined by National Instrument 43-101, supervised the preparation of the information in this news release.

The common shares of Typhoon Exploration are listed on the TSX Venture Exchange under the symbol "TYP".
