## NEW DISCOVERY BY TYPHOON AT MORE THAN 450 METERS OF THE FAYOLLE DEPOSIT

Laval, Canada May 20, 2008 – Typhoon Exploration Inc. (« **Typhoon** ») announces a third series of results of 19 drill holes completed during winter 2008 on the Fayolle property owned 100% by Typhoon.. The new results relate to the FA-08-08, 09 and 10 holes.

**The FA-08-09 drill holes has intersected a new gold zone of 1,45 g/t Au over 6,0 meters, 450 meters (1,480 feet) east of the Fayolle deposit.** This new gold mineralization was investigated following the compilation of the GOCAD data surveys realized by the firm during the fall 2007 and winter 2008 campaign. A litho-geochemical anomaly for the drill holes most east of the Fayolle deposit combined with a geophysical anomaly detected by the aerial survey has motivated the firm to investigate this area. The gold mineralization is linked to a komatiite host intensely altered with brown spar, albite and fuschite to a large felsic intrusion of intermediate composition. **It is noteworthy that the alterations and the intrusion show strong similarities with those observed on the Fayolle main deposit.**
